# Types of Clouds

by Erin Ryan

When you look up in the sky, you realize that no two clouds look exactly alike. Clouds are formed from water vapor that condenses then clusters together in droplets. There are many different types of clouds that can be seen. The types of clouds are determined based on what they look like and how high they are in the atmosphere.

High-Level Clouds	Mid-Level Clouds	Low-Level Clouds	Vertical Clouds
<p>High-level clouds are formed in altitudes above 20,000 feet. Because the temperatures are so cold at this elevation, these clouds are formed from ice crystals.</p> <p><u>Cirrus</u> clouds are thin and wispy clouds that are blown by high winds. They usually mean the day will have fair or pleasant weather, and follow the direction that the air moves at the altitude they are found at.</p> <p><u>Cirrostratus</u> clouds are like very thin sheets of clouds that cover large parts of the sky.</p> <p><u>Cirrocumulus</u> clouds look like small round puffs in the sky. Sometimes they are called mackerel clouds because they look similar to fish scales.</p>	<p>Mid-level clouds are found in altitudes between 6,500 to 20,000 feet. They are formed mainly of water droplets, but can also be made up of ice crystals when the temperature is cold enough.</p> <p><u>Altostratus</u> clouds are composed of water droplets and are gray and puffy. These clouds are usually seen on warm and humid summer mornings and are usually a sign that thunderstorms will follow later in the day.</p> <p><u>Altostratus</u> clouds are made up of ice crystals and water droplets. They can cover the entire sky and form before rain storms.</p>	<p>Low-level clouds are found below 6,500 feet and although they are mostly made up of water droplets. They can also be composed of ice particles and snow in very cold temperatures.</p> <p><u>Stratus</u> clouds are among the low-lying clouds. They are gray clouds that cover the entire sky and can be the result of very thick fog lifting in the morning.</p> <p><u>Nimbostratus</u> clouds are dark gray clouds that produce falling rain or snow.</p>	<p><u>Cumulus</u> and <u>cumulonimbus</u> clouds are both known as vertical clouds.</p> <p><u>Cumulus</u> clouds are also called fair weather clouds and look like floating cotton. They have very flat bases and are not very tall clouds. When <u>cumulus</u> clouds are first formed from droplets, they have very distinct edges, but as they move through the sky, air causes the edges to appear more ragged and broken apart.</p> <p><u>Cumulonimbus</u> clouds can take up several miles across the sky and can reach elevations of 39,000 feet or higher because of very strong updrafts in the atmosphere. Low level <u>cumulonimbus</u> clouds are made up of water droplets, but at higher elevations, they consist of ice crystals. <u>Cumulonimbus</u> clouds are the type of clouds that bring lightning, thunder, violent tornadoes and other intense weather situations.</p>
